5-MINUTE PITCH

You have

€50,000 saved.

What would you do tomorrow?

CASH **Leave it in cash**

SEARCH **Search on your own**

CALL **Call a banker**

For many mass-affluent customers, none of these feels quite right.

That is the space we are designing for.

PROBLEM

There is a missing middle

Basic self-service on one side. Full Premium advice on the other.

SELF-SERVICE

Fast and available

- product information
- digital execution
- limited context when unsure

LOW FRICTION

?

GUIDANCE GAP

PREMIUM / PRIVATE

Rich human support

- dedicated adviser
- personalised discussion
- remote / video support

HIGH TOUCH

“I felt it was more of a product push.”

C1 - direct customer interview

Cost was also a reason to leave the bank investment account.

INSIGHT

They do not need more products. They need more confidence and control.

Our early evidence changed the problem we thought we had.

UNDERSTAND

Start from life goals, not from product push.

C1

TRY

Learn and experiment before risking real money.

C1 + UX

ASK

Get human help when needed - on the customer's terms.

C1 + experts

What changed in our hypotheses

Personalisation	PARTLY SUPPORTED
Hybrid digital + human	STRONG SIGNAL
"Advisers lack tools"	CONTRADICTED

Evidence discipline

2 direct customer interviews + expert interviews + internal UX study. Strong signal - not full validation yet.

IDEA

My Wealth - a guided layer inside the banking app

Personalised guidance without forcing every customer into a full Premium relationship.

The journey

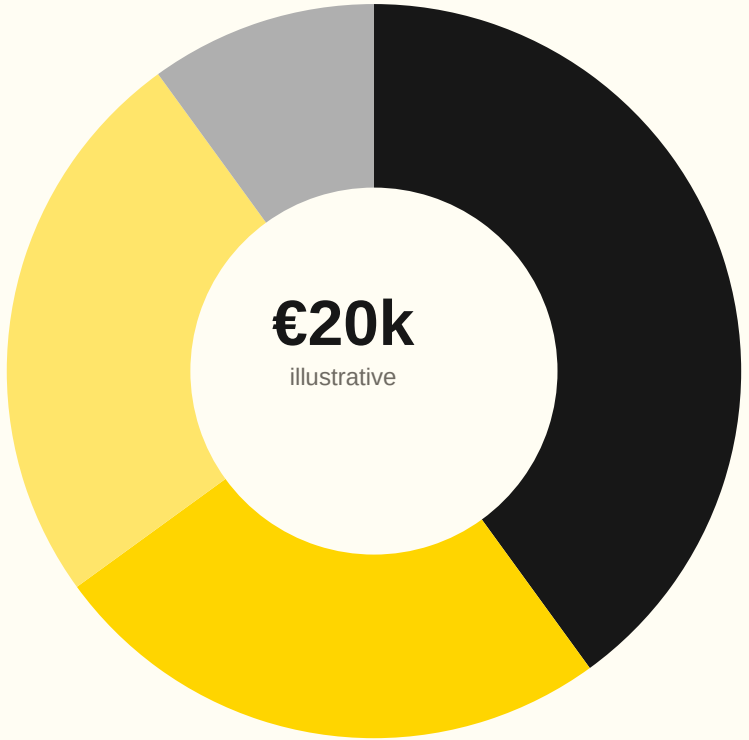

1. **Life profile** — Goal, horizon, liquidity, confidence
2. **Learn / Playground** — Simple education + safe experimentation
3. **Explore ideas** — Possible directions and trade-offs
4. **Human handover** — Adviser sees context already collected
5. **Suitable action** — Invest, keep cash, or another step

AI explains. The adviser recommends. The customer stays in control.

MAKE IT TANGIBLE

What could personalised guidance actually look like?

An illustrative €20k scenario - to explain trade-offs, not to give advice.

Example allocation

- **40%** — **Cash buffer** — Liquidity / emergencies
- **25%** — **Bond fund** — Stability / income
- **25%** — **Balanced fund** — Diversified growth
- **10%** — **Global equity** — Long-term growth

Then make it interactive

AI explains
Why might this fit my goal?

Playground tests
What happens in a market fall?

Adviser checks
Suitability, fees, products, regulation

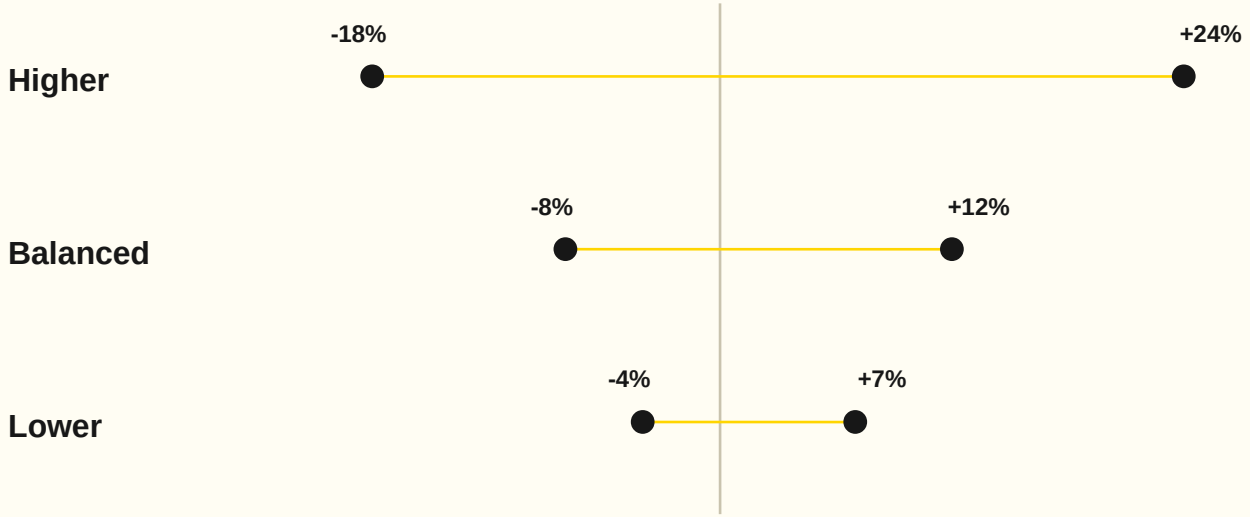

Illustrative only - not investment advice

PLAYGROUND

Let customers feel risk before they take risk

A simple simulation turns abstract words like “balanced” into something understandable.

Illustrative 1-year scenario ranges

Prototype simulation - not a forecast

The point is not prediction.

The point is understanding.

Move the slider, see what higher risk might mean, then decide whether to learn more or speak to an adviser.

LEARN BY DOING

IMPACT

Better decisions for customers. Better relationships for the bank.

We test value on both sides - not just “did the customer invest?”

Customer value

✓	**Confidence**	Understand choices and trade-offs
✓	**Control**	Choose digital or human support
✓	**Clarity**	See goals, fees, liquidity and risk
✓	**Continuity**	No restart when handed to adviser

Bank value

→	**Engagement**	More meaningful digital interactions
→	**Retention**	Fewer customers deciding elsewhere
→	**AUM potential**	More suitable investment activity
→	**Adviser capacity**	Human time at higher-value moments

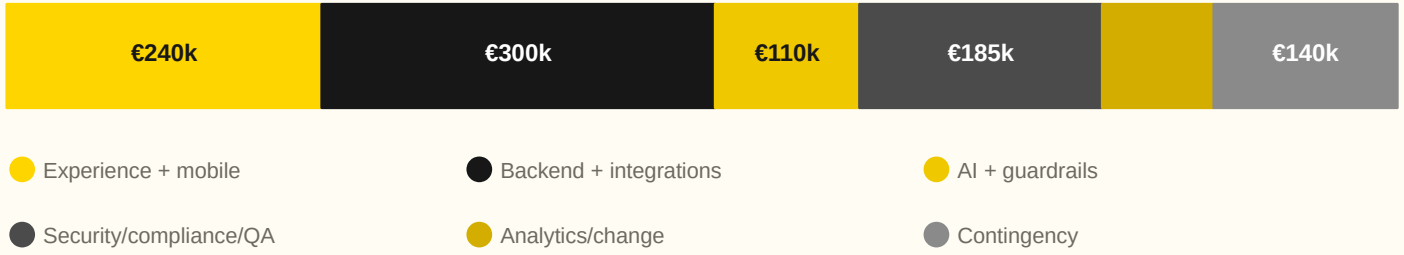

Pilot metrics: Profile completion • Learn/Playground use • Adviser handoff • Suitable action • Satisfaction • Repeat engagement

INVESTMENT

What would it take to build this inside a real banking app?

Banking-grade means integrations, security, compliance, model risk, QA and operations - not just UI.

Illustrative full-MVP build cost: ~€1.06m

ROM full MVP

€0.9m–€1.3m

Illustrative build range

What is inside that number?

Experience + mobile — UX, app screens, accessibility, release

Backend + integrations — Data, portfolio, adviser handover, CRM

AI + guardrails — Knowledge, controls, monitoring, escalation

Banking controls — Security, privacy, legal, compliance, QA/UAT

Start smaller

€300k–€400k

4–6 month controlled pilot

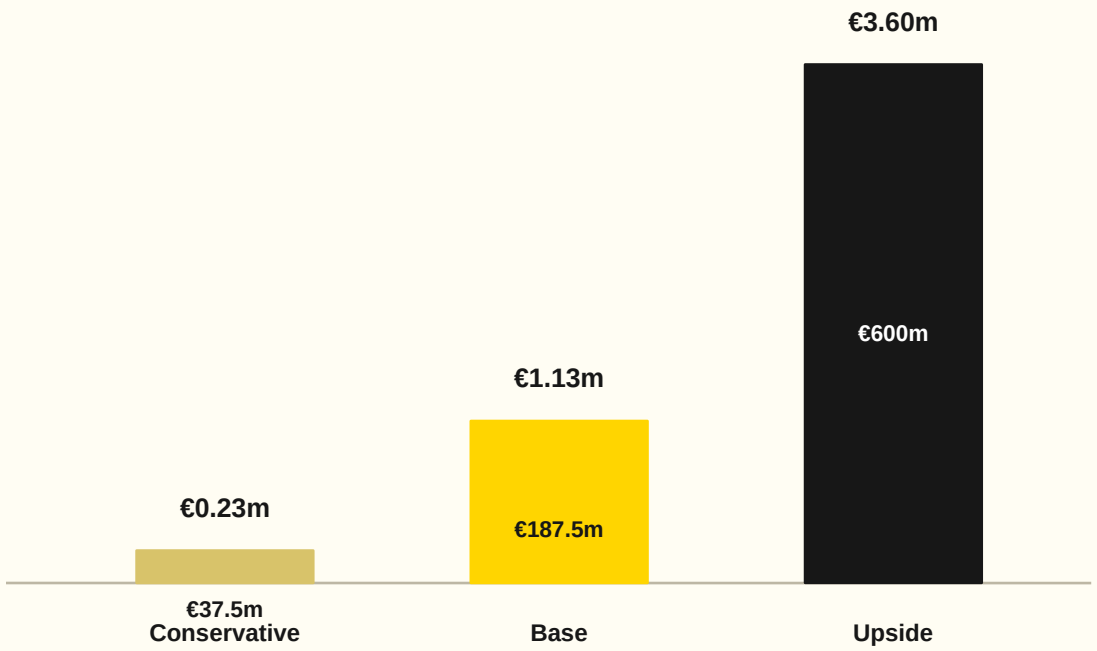

One market • limited scope • real users • cross-functional squad

BUSINESS UPSIDE

The economics can become attractive if we activate the segment

Illustrative scenarios only - actual customer counts, AUM uplift and revenue yield need RBI data.

Illustrative mature-year upside

Simple business-case formula

eligible customers × activation × incremental AUM × revenue yield

Scenario	Eligible	Active	+AUM/user	+AUM	Annual
Conservative	25k	15%	€10k	€37.5m	**€0.23m**
Base	50k	25%	€15k	€187.5m	**€1.13m**
Upside	100k	30%	€20k	€600m	**€3.60m**

Assumption: 0.6% illustrative blended annual revenue contribution on incremental invested assets.

Not included: retention, Premium conversion, FX/card/deposit value, or adviser-capacity benefits.

THE ASK

Approve a €350k pilot envelope

before we discuss a €1m+ production build.

One market. One controlled squad. Enough scope to test whether the value is real.

€80k	DISCOVERY + UX	Research, design, compliance shaping
€150k	APP + BACKEND	Limited mobile journey and integrations
€60k	AI + ANALYTICS	Education, guardrails, measurement
€60k	SECURITY + UAT	Testing, security, release readiness

Decision gate after pilot: Do customers engage? Do they understand? Do they request help? Do we see credible AUM / retention upside?

Right guidance. Right moment. Customer in control.
